

Gumbii Digital LLC

Capabilities Statement · Systems Engineering & Technical Services · Service-Disabled Veteran-Owned

Core Competencies

- **Systems integration & technical infrastructure** — design, deployment, configuration, and support of computing and networking environments: servers, workstations, structured networking, virtualization (Proxmox, Docker), storage, power protection, and monitoring; equipment configuration, calibration, repair, and vendor-hardware programming.
- **Custom software & workflow automation** — data processing, monitoring, internal tooling, API and systems integration, scheduling, and process automation, delivered as documented, maintainable systems.
- **Technical support, consulting & training** — architecture advisory, documentation, and training on infrastructure, software, distributed systems, and automation.
- **Digital media & content production** — video and media deliverables for training, simulation, and communications, including GPU-accelerated encoding, compositing, and automated content pipelines.
- **Specialized compute environments** — private high-performance compute for inference, model serving, synthetic media, and other specialized workloads, without public-cloud exposure of sensitive data.

Differentiators

- **Company-owned infrastructure, already deployed:** an eight-node GPU compute cluster, 200G network fabric, high-memory Apple development systems, and a full integration/test bench — serialized, insured, and production-ready. No spin-up delay on award.
- **One contractor, full stack:** systems, software, automation, media, and specialized compute from a single accountable vendor rather than brokered to multiple subcontractors.
- **Data stays on-premises:** sensitive workloads run on company-owned equipment at a dedicated commercial facility — not in shared public cloud.
- **Veteran-led engineering discipline:** founded, owned, and operated by a service-disabled U.S. veteran; documentation-first delivery, demonstrated by a transaction-level documented asset and operations record.

Representative Work

Designed, built, and operates a production environment of 89 scheduled hardware assets: an eight-node NVIDIA GPU cluster with 200G interconnect, multi-platform development systems, structured 10G office/lab network, virtualization and monitoring stack, and UPS-protected power. Operates commercial GPU-marketplace capacity with verified, bank-deposited earnings. Builds and runs internal automation pipelines for monitoring, documentation, and media production on the same infrastructure offered to clients.
